Results for 679 empirical networks (502 unweighted networks and 177 weighted networks) dowloaded from Netzschleuder.

Many empirical networks appear to have a low effective rank!

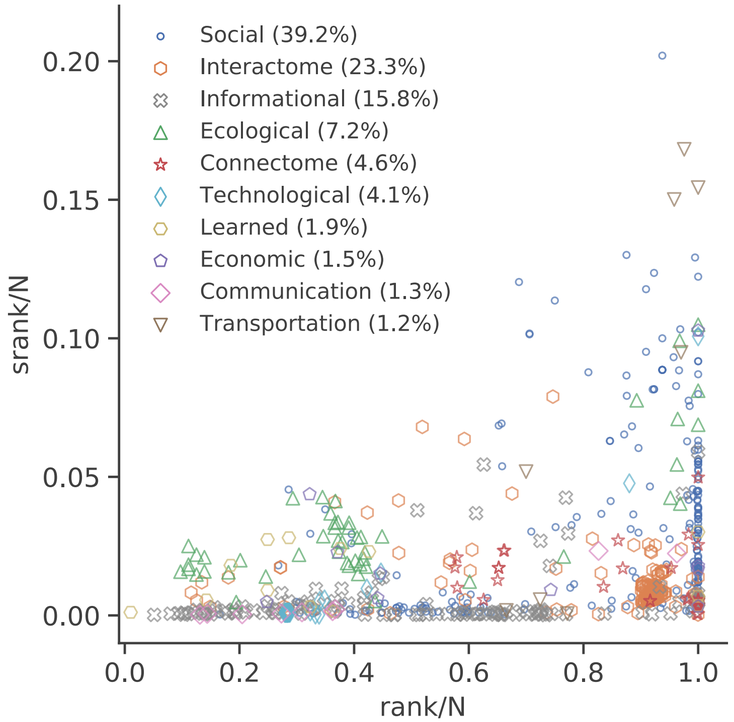
The effective ranks of adjacency matrices

But what does “low” mean?

The effective ranks of adjacency matrices

Many empirical networks appear to have a low effective rank!



Results for 679 empirical networks (502 unweighted networks and 177 weighted networks) dowloaded from Netzschleuder.

But what does “low” mean?

A *workable* definition of "low" effective rank

Hint: the rapid decrease of the dominant singular values of the adjacency matrix implies a low effective rank

- low effective rank? $\Rightarrow$ effective rank scales at most sublinearly as the number of nodes, N, goes to infitnity ($N^{1-\varepsilon}$ with $\varepsilon \in (0, 1]$)
