The effective ranks of adjacency matrices

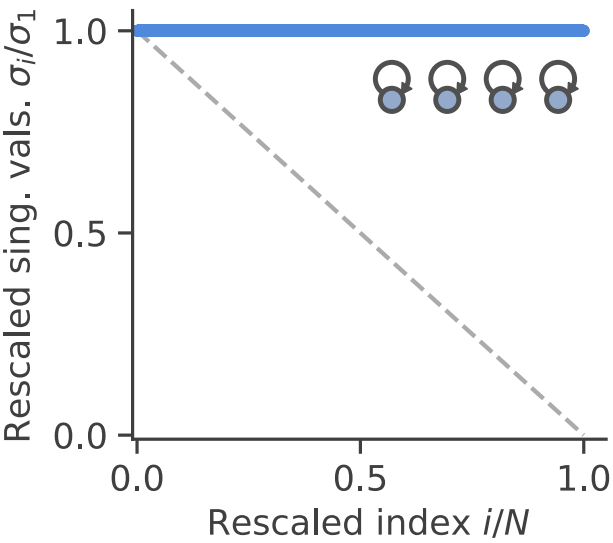

$$\mathbf{W} = \sum_{i=1}^{\textcolor{red}{r}} \sigma_i \mathbf{U}_i \mathbf{V}_i^\top \simeq \sum_{i=1}^{\textcolor{red}{n}} \sigma_i \mathbf{U}_i \mathbf{V}_i^\top$$

Effective rank n of a matrix

- ▷ number of “significant” nonzero singular values

- ▷ term after which it is “reasonable” to truncate the sum

The **singular values** (and the effective rank) encode information about the network's **topology**.
